Prealgebra Jan 25 2022 "Prealgebra is designed to meet scope and sequence requirements for a one-semester prealgebra course. The text introduces the fundamental concepts of algebra while addressing the needs of students with diverse backgrounds and learning styles. Each topic builds upon previously developed material to demonstrate the cohesiveness and structure of mathematics. Prealgebra follows a nontraditional approach in its presentation of content. The beginning, in particular, is presented as a sequence of small steps so that students gain confidence in their ability to succeed in the course. The order of topics was carefully planned to emphasize the logical progression throughout the course and to facilitate a thorough understanding of each concept. As new ideas are presented, they are explicitly related to previous topics."--BC Campus website.

No Police Like Holmes Aug 20 2021 The Investigating Arthur Conan Doyle and Sherlock Holmes Colloquium and donation of the third largest private collection of Sherlockiana in the world were supposed to produce a weekend of great publicity for tiny St. Benignus college in Erin, Ohio. But when theft and murder come to campus, college public relations director Jeff Cody finds himself knee-deep in Sherlockian suspects. Besieged by an aggressive reporter he loves but no longer dates, he is also competing with his eccentric brother-in-law, Sebastian McCabe, to solve the crimes first. The mess worsens when Jeff and his ex-girlfriend, Lynda Teal, themselves fall under suspicion of murder and with good reason, for they have something to hide. This satirical romp takes Sherlock Holmes seriously, but not Holmesians. A witty and engaging spoof sure to delight not only the deerstalker set but mystery fans in general.

A History of Abstract Algebra Sep 01 2022 This textbook provides an accessible account of the history of abstract algebra, tracing a range of topics in modern algebra and number theory back to their modest presence in the seventeenth and eighteenth centuries, and exploring the impact of ideas on the development of the subject. Beginning with Gauss's theory of numbers and Galois's ideas, the book progresses to Dedekind and Kronecker, Jordan and Klein, Steinitz, Hilbert, and Emmy Noether. Approaching mathematical topics from a historical perspective, the author explores quadratic forms, quadratic reciprocity, Fermat's Last Theorem, cyclotomy, quintic equations, Galois theory, commutative rings, abstract fields, ideal theory, invariant theory, and group theory. Readers will learn what Galois

accomplished, how difficult the proofs of his theorems were, and how important Camille Jordan and Felix Klein were in the eventual acceptance of Galois's approach to the solution of equations. The book also describes the relationship between Kummer's ideal numbers and Dedekind's ideals, and discusses why Dedekind felt his solution to the divisor problem was better than Kummer's. Designed for a course in the history of modern algebra, this book is aimed at undergraduate students with an introductory background in algebra but will also appeal to researchers with a general interest in the topic. With exercises at the end of each chapter and appendices providing material difficult to find elsewhere, this book is self-contained and therefore suitable for self-study.
