Color Measurement Jan 30 2020 Reviews and use of the first edition as the textbook for a senior-division university course indicated the need for a number of corrections and clarifications. Although no new topics have been introduced, the new edition should be more clear and useful. A novelty in the Notes and Sources Appendix should facilitate reference from the notes back to the text. For that purpose, the page number of the text to which each note refers is indicated in square brackets following the serial number of the note. The FMC1 color-difference formula has been substituted everywhere for the Friele-MacAdam formula, including the reference to the sources in Note 52. The FMC1 formula was actually used in the investigations reviewed in Sects. 8.3 and 8.4. The Friele-MacAdam formula given on page 151 of the first edition, which I thought was equivalent to the FMC1, was erroneous and should not be used. The formulas for the geodesic chromaticity diagram, on p. 153 of the first edition, were based on observations by 14 normal observers (last reference in Note 51). They have been replaced by the formulas based on the observations of PON, for consistency with all other formulas and discussions in the book. Figure 8.29 in the first edition was based on the PON data and on the formulas printed below it in the new edition. Therefore, Fig. 8.29 is unchanged.

Materials for Engineers and Technicians Dec 11 2020 A comprehensive yet accessible introduction to materials engineering which provides a straightforward, readable approach to the subject. This renowned text has provided many thousands of students with an easily accessible introduction to the wide ranging subject area of materials engineering and manufacturing processes for over forty years. It avoids the excessive jargon and mathematical complexity so often found in textbooks for this subject, retaining the practical down-to-earth approach for which the book is noted. The increased emphasis on the selection of materials reflects the increased emphasis on this aspect of materials engineering now seen within current vocational and

university courses. In addition to meeting the requirements of vocational and undergraduate engineering syllabuses, this text will also provide a valuable desktop reference for professional engineers working in product design who require a quick source of information on materials and manufacturing processes.

**Materials Selection in Mechanical Design** May 04 2020 New materials enable advances in engineering design. This book describes a procedure for material selection in mechanical design, allowing the most suitable materials for a given application to be identified from the full range of materials and section shapes available. A novel approach is adopted not found elsewhere. Materials are introduced through their properties; materials selection charts (a new development) capture the important features of all materials, allowing rapid retrieval of information and application of selection techniques. Merit indices, combined with charts, allow optimisation of the materials selection process. Sources of material property data are reviewed and approaches to their use are given. Material processing and its influence on the design are discussed. The book closes with chapters on aesthetics and industrial design. Case studies are developed as a method of illustrating the procedure and as a way of developing the ideas further.
